

# Crane Hook

## Description

Crane Hook is one of the most important devices for a crane. With the help of pulleys, the crane hook group can realize the hoisting and lifting function.

Hooks have single hook and double hooks, which are classified into five strength grades M, P, S, T, V according to the mechanical property. Forging hook and strap type hook are manufactured according to method of manufacturing.

## Advantages

- 1: We can produce crane parts according to customer requirements and application condition.
- 2: Each production procedures of each part or items is checked and supervised and recorded to ensure the quality of each part or item and each unit of equipment.

## Specification

Lifting capacity is 5t to 500t.

Customers can provide their requirements, then we will design and manufacture the hook group to meet the operational and safety requirements of industrial crane applications.

## Application

The single hook has the simple structure, which is easy to operate, but its stress condition is bad so it is mainly used in the workplace which with below 80 tons lifting capacity. When lifting capacity is big, double hook is a better choose for its load-bearing is symmetric.
