

Rolling Drum

Description

Crane Wire Rope Drum is a part of crane lifting mechanism which is used to full in, entwine, and store wire rope. The rope drum is consisted of drum shaft, flange type annular gear, drum hub, bearings, bearing pedestal, etc.

The material of drum is usually no less than HT20-40 cast iron, ZG25, ZG35 or Q235B, Q345B welding steel plate is also able to be the material for special needs.

Advantages

- 1: We can produce crane parts according to customer requirements and application condition.
- 2: Each production procedures of each part or items is checked and supervised and recorded to ensure the quality of each part or item and each unit of equipment.

Specification

Customers can provide their requirements, then we will design and manufacture the crane rope drum to meet the operational and safety requirements of industrial crane applications.

Application

Drum units applies to the large tonnage crane machinery which needs high-performance.
